Evidence-backed memory
for project decisions

Conversation evidence. Reference context.
One connected decision history.

Problem

Teams can find a statement and still miss the decision.

Scattered records

The proposal, approval, and reason for a change live across conversations and documents.

Unclear current state

A later proposal or a different release scope can be mistaken for a new approval.

Lost project context

Handovers lose the people, constraints, and dependencies behind the current plan.

Our Solution

Understand the decision, then inspect the record behind it.

Decision traces

Preserve states, scope, and history.

Connected context

Link people, constraints, and sources.

Source receipts

Open the cited message in context.

JL **John Lorenzo** 2026-10-14 09:00 M17

I checked original PDF page 25, section 3.1.1.1. It says verifiers must not require periodic password changes, while changes must be forced when there is evidence of compromise. That directly undermines the reason we used for the 30-day expiry. We should correct the decision and the onboarding checklist together.

RZ **CITED MESSAGE** **Raymund Zyron** 2026-10-14 09:06 M18

I reverse and explicitly supersede the 2026-10-13 approval of Password rotation for v1. Do not impose scheduled 30-day password changes. Require a change when compromise is evidenced, following the relevant handling process. John Lorenzo owns the checklist correction. The old approval remains in the history as a superseded decision, not as a second active policy.

Market Opportunity

A focused starting point for decision-history workflows

Capstone teams

Recover why a requirement changed and carry the rationale into project handovers.

Software teams

Investigate scope changes and inspect explicit downstream dependencies.

Project leads

Review the documented position and show the source behind an explanation.

Business Model

Proposed paths to sustainable product development

Individual entry

Explore a simple entry point for students and small project workspaces.

Team subscriptions

Validate paid collaboration, shared workspaces, and administrative needs.

Organization support

Explore deployment, onboarding, maintenance, and support services.

Prototype Validation

A repeatable demonstration with inspectable evidence

Oct 13, 2026

30-day password expiry proposed

Proposed

The legacy onboarding checklist motivates an initial 30-day expiry proposal and conditional approval; John Lorenzo's review is still pending at this point.

Scheduled rotation explicitly superseded

Reversed

The legacy checklist initially led to 30-day expiry; Raymund Zyron explicitly reverses that approval after John Lorenzo reviews the prohibition on routine changes and the compromise exception.

Market Strategy

Earn adoption through useful, reviewable investigations

Pilot partnerships

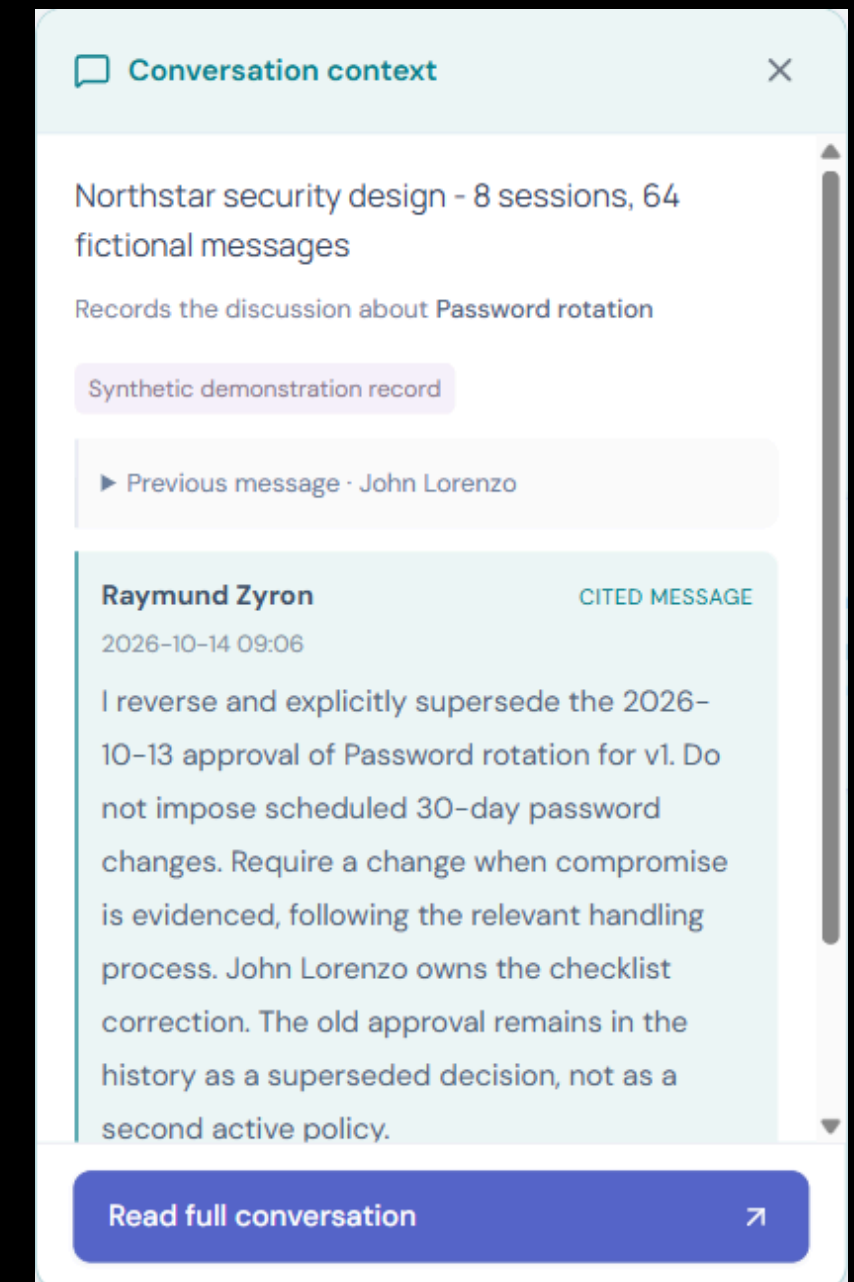

Start with capstone and small software teams.

Workflow demonstrations

Show a decision change and open its receipt.

Referrals and workshops

Share practical decision-documentation workflows.

Team

KodoTech

The team behind RAGret

Financials

Measure usage and deployment needs before forecasting.

Technology

AI requests, development, and validation. Saved extractions can be reused for unchanged records.

Pilot validation

Recruitment, demonstrations, feedback, and evaluation of evidence quality.

Future deployment

Hosting, storage, backups, access controls, monitoring, and support.
